

## Block 2-4

$$1. F = BIL \quad B = \mu_0 I / (2\pi r)$$

$$F = [\mu_0 I_1 / (2\pi r)] I_2 L$$

$$F = [2 \times 10^{-7} \times 3.0 \text{ A} / 0.02 \text{ m}] \times 4.0 \text{ A} \times 0.40 \text{ m}$$

$$(2 \times 3 / 0.02) \times 4 \times 0.4 = 480.0$$

$4.8 \times 10^{-5} \text{ N}$  away from each other (RHR)

2

a) RHR - clockwise and constant (change is out of the page and constant, so induced current creates B into the page and constant)

b)  $\text{emf} = NBA/t = 50 \times (0.25 + 0.50) \times (3.14159 \times 0.04 \times 0.04) / 0.3 = 0.62832 \text{ V}$   
 $I = V/R = 0.62832 / 0.5 = 1.25664 \text{ A} \approx 1.3 \text{ A}$

$$3. V_{\text{back}} = \text{emf} - Ir$$

$$r = V/I \text{ no rotation} \quad r = 6/8 = 0.75 \text{ ohms}$$

$$V_{\text{back}} = 6 - (4 \times 0.75) = 3.0 \text{ V}$$

4. X to Y, current opposes change in flux

no B to B left, so induced current creates B right, thumb right fingers show current X to Y.

## Block 2-3

$$B = \frac{\mu_0 I_2}{2\pi r} \quad F = B I_1 L$$

1.  $F = BIL$   $B = \mu_0 I / (2\pi r)$

$F = [\mu_0 I_1 / (2\pi r)] I_2 L$

$F = [2 \times 10^{-7} \times 2.0 \text{ A} / 0.02 \text{ m}] \times 5.0 \text{ A} \times 0.40 \text{ cm}$

$(2 \times 2 / 0.02) \times 5 \times 0.40 = 400$

$4.0 \times 10^{-5} \text{ N}$  towards each other (RHRs)

2

a) RHR - clockwise and constant (change is out of the page and constant, so induced current creates B into the page and constant)

b)  $\text{emf} = NBA/t = 90 \times (0.25 + 0.50)$

$\times (3.14159 \times 0.04 \times 0.04) / 0.3 = 1.13097 \text{ V}$

$I = V/R = 1.13097 / 0.5 = 2.26194 = 2.3 \text{ A}$

1.  $V_{\text{back}} = \text{emf} - Ir$

$r = V/I$  no rotation  $r = 6/8 = 0.75 \text{ ohms}$

$V_{\text{back}} = 6 - (3 \times 0.75) = 3.75 = 3.8 \text{ V}$  (3.7 V or 3.75V OK)

2. Y to X, current opposes change in flux

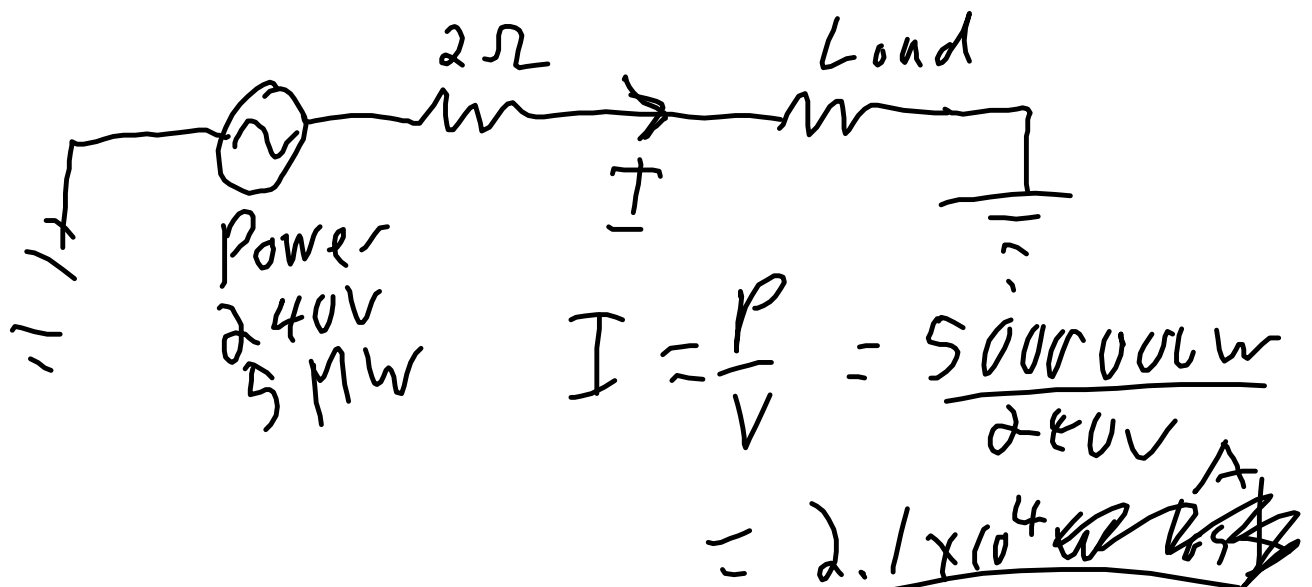

B to the left changes to no B, so induced current creates B left, thumb left fingers show current X to Y in the solenoid, so Y to X in the galvanometer.

eg. a generator provides 240V and  $5.0 \times 10^6 \text{ W}$  of power through 2.0 ohm transmission cables. How much power is lost by heat in the cables if

- no transformer?
- a transformer with 10 loops in the primary and 100 loops in the secondary is used before the cables?
- what if the secondary has 1000 loops?

$$P = I^2 R = \frac{2.1 \times 10^4 \text{ W}}{(2.1 \times 10^4 \text{ W})^2 (2)}$$

Not Possible

$$b) \frac{N_p}{N_s} = \frac{I_s}{I_p}$$

$$\frac{10}{100} = \frac{I_s}{2.1 \times 10^4}$$

$$I_s = 2.1 \times 10^3$$

$$P_{\text{lost}} = (2.1 \times 10^3)^2 (2)$$

Still not possible

$$c) (2.1 \times 10^2)^2 (2) = 8.8 \times 10^4 \text{ W}$$

Possible but still bad

## Block 2-2

$$1. F = BIL \quad B = \mu_0 I / (2\pi r)$$

$$F = [\mu_0 I_1 / (2\pi r)] I_2 L$$

$$F = [2 \times 10^{-7} \times 2.0 \text{ A} / 0.02 \text{ m}] \times 4.0 \text{ A} \times 0.40 \text{ cm}$$

$$(2 \times 2 / 0.02) \times 4 \times 0.4 = 320$$

$$3.2 \times 10^{-5} \text{ N} \text{ away from each other (RHR)}$$

2

a) RHR - clockwise and constant (change is out of the page and constant, so induced current creates B into the page and constant)

b)  $\text{emf} = NBA/t = 70 \times (0.25 + 0.50)$   
 $\times (3.14159 \times 0.04 \times 0.04) / 0.3 = 0.87965 \text{ V}$   
 $I = V/R = 0.87965 / 0.5 = 1.7593 = 1.8 \text{ A}$

3.  $V_{\text{back}} = \text{emf} - Ir$

$r = V/I$  no rotation  $r = 6/8 = 0.75 \text{ ohms}$

$V_{\text{back}} = 6 - (2 \times 0.75) = 4.5 \text{ V}$

X to Y, current opposes change in flux

no B to B left, so induced current creates B right, thumb right fingers show current X to Y.
